# **Kubernetes Project-02**

# **Kubernetes Multi-Tenant Project**

#### **Step 1: Check if Any Worker Node is Ready**

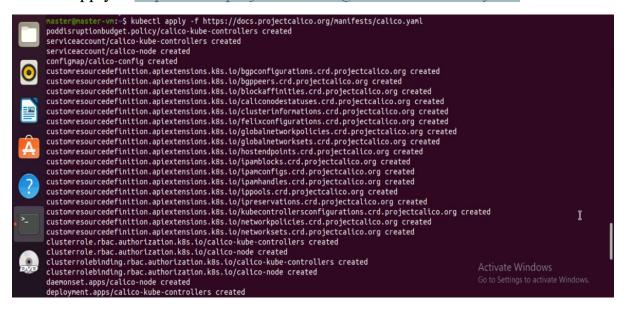

kubectl get nodes

#### Step 2: Install Calico for Networking

Apply the Calico manifest to enable networking:

kubectl apply -f https://docs.projectcalico.org/manifests/calico.yaml

#### **Step 3: Create Namespaces for Tenants**

To isolate tenants, create separate namespaces:

kubectl create namespace tenant-a

kubectl create namespace tenant-b

```
master@master-vm:-$ kubectl create namespace tenant-a namespace/tenant-a created master@master-vm:-$ kubectl create namespace tenant-b namespace/tenant-b created
```

## **Step 4: Create Folder Structure for YAML Files**

Create the folder structure to organize YAML files for each tenant:

mkdir -p ~/k8s-multi-tenant/tenant-a

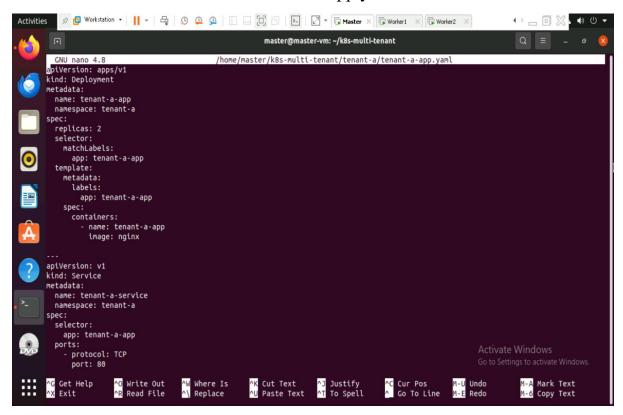

mkdir -p ~/k8s-multi-tenant/tenant-b

cd ~/k8s-multi-tenant

## **Step 5: Create Deployment and Service for Tenant A**

nano ~/k8s-multi-tenant/tenant-a/tenant-a-app.yaml

## Apply the configuration:

kubectl apply -f ~/k8s-multi-tenant/tenant-a/tenant-a-app.yaml

```
? master@master-vm:~/k8s-multi-tenant$ kubectl apply -f ~/k8s-multi-tenant/tenant-a/tenant-a-app.yaml deployment.apps/tenant-a-app created service/tenant-a-service created
```

## Verify the deployment:

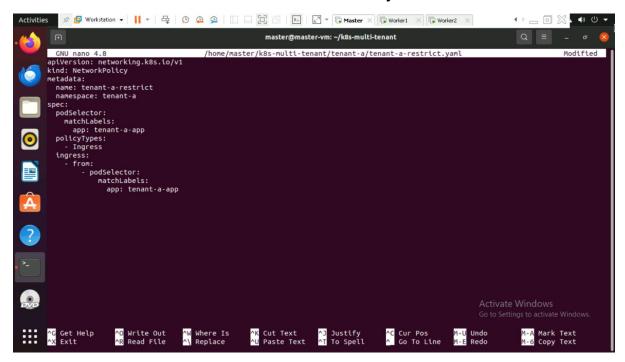

kubectl get pods -n tenant-a

kubectl get svc -n tenant-a

```
ant$ kubectl get pods -n tenant-a
                              READY
NAME
                                     STATUS
                                               RESTARTS
                                                          AGE
tenant-a-app-57856ccbdc-dxf58
                                      Running
                                                           45m
                                                                                                  Activate Windows
tenant-a-app-57856ccbdc-hdnrx
                                      Running
master@master-vm:~/k8s-multi-tenant$ kubectl get svc -n tenant-a
                  TYPE
                             CLUSTER-IP
                                             EXTERNAL-IP PORT(S)
                                                                    AGE
tenant-a-service ClusterIP 10.98.242.192 <none>
```

#### **Step 6: Restrict Network Access for Tenant A**

nano ~/k8s-multi-tenant/tenant-a/tenant-a-restrict.yaml

#### Apply the network policy:

kubectl apply -f ~/k8s-multi-tenant/tenant-a/tenant-a-restrict.yaml

```
master@master-vm:~/k8s-multi-tenant$ kubectl apply -f tenant-a/tenant-a-restrict.yaml
networkpolicy.networking.k8s.io/tenant-a-restrict created
```

## **Verify Network Policy**

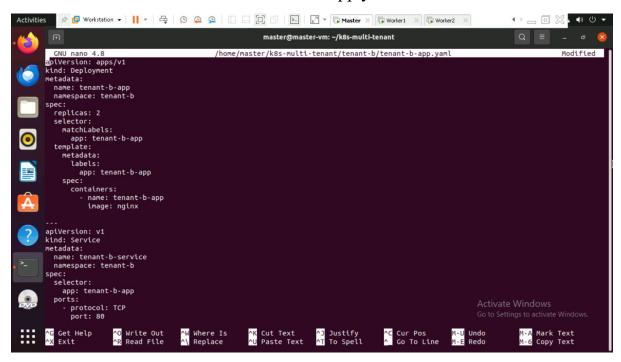

To verify the network policy for Tenant A, run the following commands:

kubectl get networkpolicy -n tenant-a

kubectl describe networkpolicy tenant-a-restrict -n tenant-a

## **Step 7: Create Deployment and Service for Tenant B**

nano ~/k8s-multi-tenant/tenant-b/tenant-b-app.yaml

## Apply the configuration:

kubectl apply -f ~/k8s-multi-tenant/tenant-b/tenant-b-app.yaml

```
master@master-vm:~/k8s-multi-tenant$ kubectl apply -f ~/k8s-multi-tenant/tenant-b/tenant-b-app.yaml Go to Settings to activate Windows.
deployment.apps/tenant-b-app created
service/tenant-b-service created
```

# Verify the deployment:

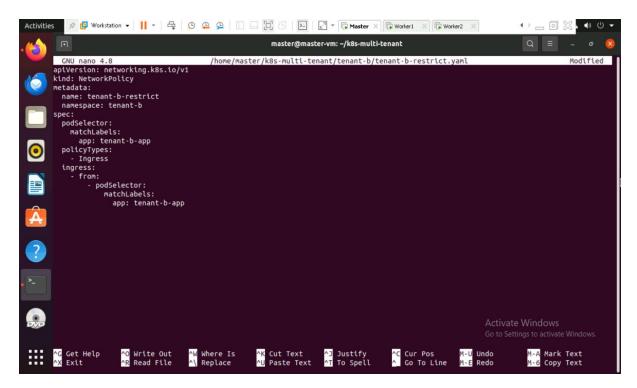

kubectl get pods -n tenant-b

kubectl get svc -n tenant-b

```
aster@master-vm:~/k8s-multi-tenant$ kubectl get pods -n tenant-b
NAME
                             READY STATUS
                                              RESTARTS AGE
tenant-b-app-bbb987489-c2kf2
                                     Running
                            1/1
                                                         35s
tenant-b-app-bbb987489-r62dd 1/1
                                     Running
master@master-vm:~/k8s-multi-tenant$ kubectl get svc -n tenant-b
                  TYPE
                             CLUSTER-IP
                                              EXTERNAL-IP PORT(S)
                                                                    AGE
tenant-b-service ClusterIP 10.111.180.125 <none>
```

**Step 8: Restrict Network Access for Tenant A** 

nano ~/k8s-multi-tenant/tenant-b/tenant-b-restrict.yaml

#### Apply the network policy:

kubectl apply -f ~/k8s-multi-tenant/tenant-b/tenant-b-restrict.yaml

```
master@master-vm:~/k8s-multi-tenant$ kubectl apply -f tenant-b/tenant-b-restrict.yaml
networkpolicy.networking.k8s.io/tenant-b-restrict created
```

## **Step 9: Verify Network Policy**

To verify the network policy for Tenant B, run the following commands:

kubectl get networkpolicy -n tenant-b

kubectl describe networkpolicy tenant-b-restrict -n tenant-b

```
ulti-tenant$ kubectl get networkpolicy -n tenant-b
                  POD-SELECTOR
tenant-b-restrict
                  app=tenant-b-app
 master@master-vm:~/k8s-multi-tenant$ kubectl describe networkpolicy tenant-b-restrict -n tenant-b
             tenant-b-restrict
Namespace:
             tenant-b
Created on:
            2025-03-15 15:27:43 +0530 IST
Labels:
             <none>
Annotations: <none>
  PodSelector:
                  app=tenant-b-app
  Allowing ingress traffic:
   To Port: <any> (traffic allowed to all ports)
      PodSelector: app=tenant-b-app
  Not affecting egress traffic
 Policy Types: Ingress
```

# **Step 11: Test Tenant Isolation**

Create a test pod in tenant-b and check access to tenant-a:

In worker docker run: docker pull alpine

kubectl run test-pod --image=alpine -n tenant-b --restart=Never -- sleep 3600 kubectl exec -it test-pod -n tenant-b -- wget --spider tenant-a-service.tenant-a

```
master@naster-vn:-/k8s-multi-tenant$ docker pull alpine
Using default tag: latest
latest: Pulling from library/alpine
f18232174bc9: Pull complete
